

Digital transformation is the incorporation of new technologies and new ways of working within your corporate environment. It is seen as the only way for your company to continue to be competitive in the decades to come. Whether it is in regards of hardware or your business applications.

But what about all the applications still running in the background and needing a lot of maintenance and support?

They have already put their trust in us:

### The life cycle of an application

As exiting and innovating the development of new application to boost your companies productivity may be, we tend to forget that what happens next is mostly the biggest part of it. The general life-expectancy of a business application is in many cases counted in decades in stead of years. As the development-phase of such application is mostly done within a year, the maintenance, Support and the development of new functionalities is done over the remainder of its life.

### **This is where Rhea Comes in!**

With our experience bridging over 20 years in the maintenance & support of third party applications, we ensure the continuity of your business through the correct functioning of the business applications of the past. In thus letting your development teams focus on projects of the future.

In short we believe that by streamlining operations, your company can focus on their core competencies. this leads to financial leveraging by reducing fixed costs which enables refunding of budget and frees up ICT resources that are more than usually responding to internal calls regarding problems or requests around your existing business applications.

For more information see **Rhea: Service management**
