

RHEA BUSINESS APPLICATIONS

At Rhea we specialize in business applications for corporate environments and have broken down our services in 3 main topics:

Maintaining and supporting business applications, re-development (re-design) of legacy applications and building upon the re-developed applications or completely new applications with technologies on the edge of today's capabilities, such as: IOT, RPA and AI.

They have already put their trust in us:

Enhanced development:

With enhanced developments we mean building upon newly made business applications (re-development of legacy applications or completely new applications) in enhancing them, for example, with new technologies such as IOT, RPA and A.I.. This will not only ensure that your business is at the edge of it's technical capabilities, but also ready for any future developments in these fields. A seamless integration into your already existing business processes is obviously key!

Re-development of legacy applications:

As many applications have been written sometimes decades ago, it goes without saying that these applications do no longer work properly (and as a result cost quite the amount of money to maintain) due to, for example, many expansions and are a great security risk for your company as technology has made leaps and bounds in the past years. At Rhea we re-develop these applications in the same way as they are currently used, but with a complete fresh backbone. This means your business applications will cost much less to maintain, be secure, protected from data loss, quicker and easier to use, open to potentially interconnect with other systems (like a CRM or other open applications) and future proof.

Maintenance and support:

At Rhea we have 20+ years of experience in maintaining, supporting and further developing third party business applications. As the base of our offering over the years we ensure that those critical business applications, built by others, keep functioning as they should and this for as long as the technology it was written in permits it. Thanks to our other fields of expertise (as mentioned above), we can furthermore ensure a smooth transition towards the future of your business applications.
