INTELLIGENT APLICATIONS DESIGN
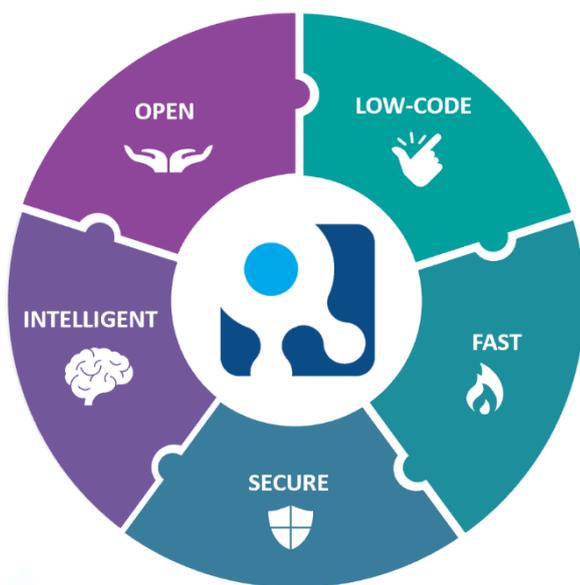

At Rhea we use a modular and revolutionized way of looking at business applications and instead of making stand alone and costly applications we re-focus our self to make them: by the low-code principle, Fast, Secure, Intelligent and Open.

This will not only ensure they are future proof, but also less costly and easier to use for all levels within your organization.

They have already put their trust in us:

Low-Code

Quickly build applications to optimize any process across people with virtually no code. Battle tested and improved for over a decade on a wide range of customer projects.

Fast

Build with fast, clean and light-weight code to minimize platform overheads. Our REST based architecture allows you to scale out easily.

Secure

Secure by design with built-in fine-grained access control per user or application group. Our platform is revised on a regular basis for security flaws by an external security partner.

INTELLIGENT

Intelligent automation enhances process quality, reduces risk and optimizes your operations. Real-time analytics and insights allow you to govern, analyse, and drive the efficiency of your business processes.

Open

Components can be easily customized to the needs of every project, providing ultimate flexibility. With the full power of the .NET Framework and access to all of our source code, you are never locked in.

This approach enables us to not only deliver an application that will survive the challenges of time, but actually helps the companies we work with to refocus their time on their core business and not on tedious applications that limit their internal development and are not using the data lakes as they should be. This at a competitive pricing and in a totally secured environment.
