

VULNERABILITY: THE GROWING DANGER OF 2020

In 2018, 28 companies in Belgium were officially confronted with the issue of ransomware. In 2019 this number grew to 125 companies in Belgium. Or an augmentation of 500%.

How vulnerable is your system still today? Who has access to what information? And how secure am I from external attacks?

Well, remember that business applications built 10+ years ago were with no embedded security for it was only used for internal use?

Rhea and your security

At Rhea we re-design your existing business applications to not only be future proof, but mainly secure. We work with external specialized security companies to ensure that the re-designed business applications we make are embedded with the best security measures that are available today and will be in the future.

Add on top of that, you gain the possibility of adding artificial intelligence or robot process automation to minimize human error in the future, and you have a timeless security feature.

At Rhea we secure your business by following 4 simple rules in the (re)development of these applications:

Secure by design

Instead of the application having a security layer imbedded in it, the flow of the application in itself is controlled by the underlying security.

Threat detection

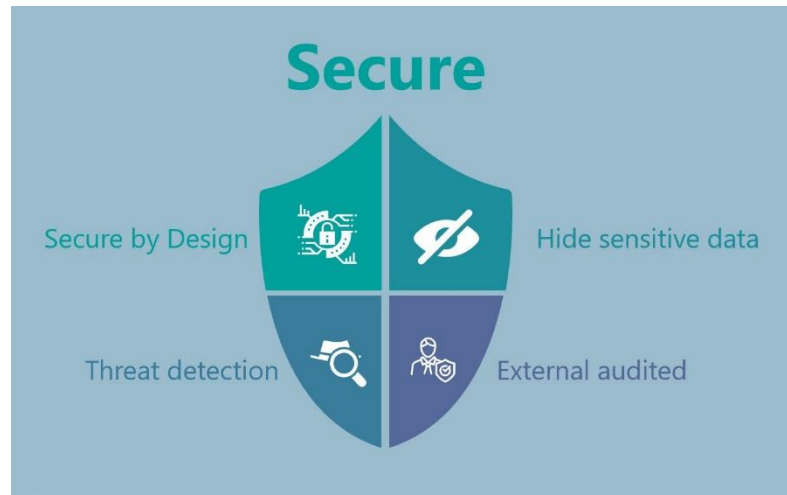

With a native and ever-evolving system we go one step further with the wisdom that preventing is better than curing. Our applications will notify you when suspicious behavior is detected and will even automatically throttle or block suspicious users.

Externally audited

At Rhea we take your security at heart and thus have regular tests on our environment by third party experts in ICT security to ensure our developed applications are up to date and perfectly secure.

Hide sensitive data

Sensitive data is encrypted through the business application itself and can only be read when the encryption key is released through this application or an administrator, and thus protecting your sensitive data if worst comes to worst.

They have already put their trust in us:
